Tutorial 2 (Semantic Structure and Internal Linking)

Assume that the directory and file structure depicted in **Figure 1** will be used for the LevelUp website.

Figure 1 – Directory and File structure for “LevelUp” website

Expand the Home Page (`index.html`) of the **LevelUp** website that you created in Tutorial 1. The resulting page should look exactly as indicated in **Figure 2**.

Please note the following:

- All the text content for this page has already been added to the provided `index.html` file. Any text that still has to be marked up appears without HTML elements. (**Tip:** Work through the file from top to bottom.)
- Add a `meta` element to the `head` section to identify yourself as the author of this page.
- Add HTML semantics to divide this page into the relevant parts, as indicated in **Figure 2**.
- The Featured Tip content must be grouped in a `section` element with an `id` attribute. The value of the `id` attribute must be `featured`.
- “Featured Tip of the Week” is a level-2 heading.
- “Home” (referring to the current page) should not be a hyperlink on this page.
- “Featured Tip” in the navigation should link to the `featured` section further down on this same page.
- “Back to top” should link back to the top of this same page. Note that you will have to add an `id` attribute to the first element that appears **inside** the `<body>` of your markup.
- Display the `pomodoro.png` image with dimensions of 120 x 120 pixels and give it suitable alternative text.
